

How chrisrohn.com uses the YouTube Data API

Verifying playlist contents, adding user-approved tracks and removing them, within the signed-in user's own year-based playlists. A walkthrough in screenshots of the API client, with the client's own request log.

What the API client is

chrisrohn.com is a personal new-music discovery site. There is no server: the API client is the web page itself, running in the browser of a user signed in with Google, calling the YouTube Data API v3 directly with the OAuth token Google issued to them. It manages only that user's own playlists — for the curator, one playlist per year named <year> | Indie Discotheque in his YouTube Music library. Nothing runs in the background and nothing writes without a tap; every write shows an Undo. The complete source is public at github.com/chrisrohn/chrisrohn.

The only requests it makes

What	Endpoint	Quota	When
Verify playlist contents	playlistItems.list (playlistId, paged)	1 / 50 tracks	On sign-in and every 30 minutes: this year's playlist is read so tracks saved from another device are hidden and Keep never files a second copy
Verify one video	playlistItems.list (playlistId + videoId)	1	Right before an add to another year's playlist, and before every removal, to find the exact playlist items holding that video
Add the approved track	playlistItems.insert	50	Only when the user presses ▲ Keep on a card: the video goes into the year playlist chosen on the card
Remove a track	playlistItems.delete	50	Undo within seconds of a Keep; restoring a skipped track; Cleanup: the extra copy of a song added twice, a copy filed in the wrong year, or a copy that no longer streams (swapped for the upload that does)
List the library	playlists.list (mine=true)	1 / 50	Guests only, to find or create their own "<year> Picks from chrisrohn.com" playlist. The curator's year playlists are pinned by id; the client never creates them

Why more quota: filling the earlier years from listening history (the Catalog tab, 48 year playlists from 1979) and cleaning the playlists of duplicates and dead uploads (the Cleanup tab) spend 50 units per add or removal, so the default 10,000 units allow about 200 playlist edits a day. The client paces itself: a visible quota meter, bulk actions limited to what the day's quota covers, and one playlist reading reused for every Keep in the following half hour.

The pages that follow are screenshots of the client, in the order a curator uses it. The client's own API activity view (⚙ → API activity) lists each request as it happens with its endpoint, parameters, HTTP result, quota cost, and what it was for. The full request log from this walkthrough is in the appendix.

STEP 1

The feed, signed in as the curator

The signed-in curator sees three verdict buttons on every card: $\neq$ wrong video, $\blacktriangledown$ Skip, $\blacktriangle$ Keep. The year select on each card names the playlist a Keep will file into (verified release year from MusicBrainz, Discogs and the other catalogues; the curator can change it). Anyone can listen; only a signed-in account whose playlists these are can write, and only from this browser.

REVIEW

STEP 2

Settings: the account, the quota meter and the API activity view

⚙️ shows the Google account, the year playlists the build knows by id, the running quota meter for the day (each write 50 units, each read 1), the Drive mirror that keeps ratings in step across devices, and the API activity button that opens the live request log.

■ SETTINGS

Signing in uses YouTube API Services; see the [Privacy Policy](#) and [Terms](#). Anyone can listen here. **Sign in with Google** and the Keep / Skip buttons appear: ▲ **Keep** adds the track to a year playlist in *your own* YouTube library right away (curator: <year> | Indie Discotheque ; guests: <year> Picks from [chrisrohn.com](#)), with Undo for a few seconds. ▼ **Skip** hides it for good. ≠ **Wrong video** is for a card whose YouTube match plays something other than the title it shows: it hides the card without judging the song, costs nothing, and tells the daily build to look for another upload — the card is back the moment one is found. Your ratings are mirrored to a hidden app-data file in your own Google Drive, so every device you sign into stays in step. Nothing else is touched.

48 year playlists known (1979–2026)

~1 of 10,000 YouTube API units used today by your devices (199 more saves) · resets midnight Pacific **API ACTIVITY**

Ratings not synced yet — sign in to sync across devices (uses a hidden app-data file in your Google Drive).

Install as an app for a full-screen feed from its own icon, offline with the last feed, and lock-screen play/pause/next. **INSTALL AS AN APP** build 9a57706993

Google sign-in lasts an hour at a time and renews itself the next time you tap a thumb. **Sign out** only forgets this device; to disconnect the site from your Google account entirely, remove it at [myaccount.google.com/permissions](#).

GITHUB TOKEN FOR THE RATINGS FILE

GITHUB_PAT_... (FINE-GRAINED: CONTENTS READ & WRITE, THIS REPO ONLY)

No token: the build only learns from the year playlists and the Skipped playlist. Paste a fine-grained token (Contents: read and write on [chrisrohn/chrisrohn](#)) and every keep and skip reaches tomorrow's build — free local skips included.

PUSH RATINGS TO THE BUILD NOW

MAKE A TOKEN

1207 duplicated songs in the year playlists (checked 2 d ago) · 1 not streamable here (1 with a streamable counterpart) **OPEN CLEANUP**

Guest rating is **off** (other Google accounts get a listen-only site). This is a site-wide switch, so it lives in the repo: [edit config.yaml](#) → `google.guests: true`. Takes effect at the next daily build (or run the Discover workflow).

STEP 3

On sign-in: verify what this year's playlist already holds

The moment a curator signs in (and again every 30 minutes) the client reads “2026 | Indie Discotheque” with `playlistItems.list`, one unit per page of 50. Anything the playlist already holds, including tracks saved from a phone, is hidden from the feed, and this reading is what the duplicate guard uses so a Keep never files the same video twice.

■ API ACTIVITY

Every request this browser makes to the YouTube Data API, as it happens. The site only ever does three things with it: **read** a playlist to verify what it already holds, **add** the track you approved with ▲ Keep, and **remove** one you took back (Undo, restore) or that the Cleanup tab found twice. Nothing runs in the background and nothing writes without a tap. Kept on this device only.

1 request remembered on this device · 1 read (1 unit each) · 0 writes (50 units each) · ~1 of 10,000 YouTube API units used today by your devices (199 more saves) · resets midnight Pacific

```
17:07:40    GET    /playlistItems                200 · 1u · 293ms
              playlistId=PLTW5JZnPjE_q3bQltmawTeCJNF...
```

Verify what “2026 | Indie Discotheque” already holds, so tracks filed from another device are hidden and Keep never adds a second copy

COPY AS TEXT

DOWNLOAD JSON

CLEAR

DONE

STEP 4

Keep: the curator approves a track

Pressing ▲ Keep files the track at once. The toast confirms the playlist it went to — “2026 | Indie Discotheque” — and offers Undo for a few seconds. This tap is the one action that writes to YouTube; there are no scheduled or automatic adds.

STEP 5

The request behind the Keep

API activity shows the write: POST playlistItems with the playlist id and the video id, HTTP 200, 50 units, and the reason in words — Keep: add the approved track to “2026 | Indie Discotheque” — with the track it concerned. Because this year's playlist was verified a moment ago (step 3), no extra read was needed.

API ACTIVITY

Every request this browser makes to the YouTube Data API, as it happens. The site only ever does three things with it: **read** a playlist to verify what it already holds, **add** the track you approved with ▲ Keep, and **remove** one you took back (Undo, restore) or that the Cleanup tab found twice. Nothing runs in the background and nothing writes without a tap. Kept on this device only.

STEP 7

Verify, then add

For a playlist that was not read recently the client first calls GET playlistItems with playlistId and videoid — Keep: verify “2025 | Indie Discotheque” does not already hold this video before adding it (1 unit) — and only when nothing comes back does it POST the item (50 units). If the video were already there, the Keep would be recorded as a duplicate and nothing added.

API ACTIVITY

Every request this browser makes to the YouTube Data API, as it happens. The site only ever does three things with it: **read** a playlist to verify what it already holds, **add** the track you approved with ▲ Keep, and **remove** one you took back (Undo, restore) or that the Cleanup tab found twice. Nothing runs in the background and nothing writes without a tap. Kept on this device only.

STEP 10

Cleanup: what the daily build found in the year playlists

The daily build (a GitHub Actions job that reads the public year playlists with an API key and never writes) reports songs whose video appears twice in a year playlist or in two different years, and tracks that no longer stream in the playlists' region. The Cleanup tab lists them, paced by the day's quota, and every removal is a tap with a confirmation.

**CHRIS ROHN'S NEW MUSIC**
240 CANDIDATES · 181 NEW TO...

FEED [136] CATALOG [321] PICKS [41] SKIPPED [0] **CLEANUP [1208]** CHRIS ROHN **CURATOR** **SIGN OUT**

CLEANUP

1207 duplicated songs in the year playlists (checked 2 d ago) · 1 not streamable here (1 with a streamable counterpart)

Every Keep first checks the target playlist, so the same video is never added twice by the site. The daily build scans all year playlists for the exact same video appearing twice in a year (an extra copy: remove it, one stays) or in two different years (a filing question: the verified year marks the wrong copy). It also notes every track YouTube Music greys out in the US (label rights, a withdrawn upload, a region lock) and looks for another upload of the same song that streams here, the audio track first: **not streamable here** in the kind menu, where a swap adds the counterpart and removes the dead copy. A removal costs 50 YouTube API units and a swap 100, so this is a job for a few minutes a day; what you clean is remembered on every device you sign into.

~152 of 10,000 YouTube API units used today by your devices (196 more saves) · resets midnight Pacific · about 183 removals possible today

STEP 13

The requests behind a swap

A swap is verify → add → verify → remove: GET to confirm the playlist does not already hold the streamable upload, POST to add it, GET to find the items holding the dead video, DELETE to remove them. 102 units. Everything the client did in this walkthrough is in the log on the next page.

API ACTIVITY

Every request this browser makes to the YouTube Data API, as it happens. The site only ever does three things with it: **read** a playlist to verify what it already holds, **add** the track you approved with ▲ Keep, and **remove** one you took back (Undo, restore) or that the Cleanup tab found twice. Nothing runs in the background and nothing writes without a tap. Kept on this device only.

11 requests remembered on this device · 5 reads (1 unit each) · 6 writes (50 units each) · ~305 of 10,000 YouTube API units used today by your devices (193 more saves) · resets midnight Pacific

17:08:00	DELETE	/playlistItems id=UExUVzVKWm5QakVfZGVhZA	204 · 50u · 168ms
Cleanup: remove the copy that no longer streams here from "2021 Indie Discotheque" Jungle - Keep Moving			
17:08:00	GET	/playlistItems playlistId=PLTW5JZnPjE_r-QVi3wDsHGekh6...	200 · 1u · 258ms
Cleanup: verify which playlist items hold this video before removing any Jungle - Keep Moving			
17:08:00	POST	/playlistItems playlistId=PLTW5JZnPjE_r-QVi3wDsHGekh6...	200 · 50u · 163ms
Cleanup: add the upload of this song that streams here to "2021 Indie Discotheque" Jungle - Keep Moving			
17:08:00	GET	/playlistItems playlistId=PLTW5JZnPjE_r-QVi3wDsHGekh6...	200 · 1u · 220ms
Cleanup: verify "2021 Indie Discotheque" does not already hold the streamable upload Jungle - Keep Moving			
17:07:57	DELETE	/playlistItems id=UExUVzVKWm5QakVfMg	204 · 50u · 153ms
Cleanup: remove the extra copy of a song added twice to "2025 Indie Discotheque" (one copy stays) The Dare - I Can't Escape Myself			
17:07:56	GET	/playlistItems playlistId=PLTW5JZnPjE_onNanNGWFyek1i...	200 · 1u · 260ms
